

## Unisys

Unisys' data center outsourcing practice is strong in the government and public sector verticals, followed by the banking and financial market. Most of its clients are mid-sized in nature and typically have standard virtualization requirements. It currently has around 29 data centers across the globe, of which 12 are owned and 17 are partnered. Unisys has strategic partnerships with Dell EMC, Microsoft and AWS for its cloud CloudForte™ requirements with Microsoft Azure, AWS, private and hybrid clouds. It also has good relationships with technology partners such as VMware, Cisco, SAP, Oracle, Equinix and Salesforce among others. Unisys CloudForte™ accelerates digital transformation and maximizes innovation in the cloud without sacrificing security or governance. CloudForte™ accelerates with self-service blueprints, automated governance and workflow, automated provisioning, security, reporting and advanced analytics.

Unisys has a long-standing implementation service called Data Center Transformation Service (DCTS) which helps clients to consolidate, migrate, optimize, and automate their data centers and achieve a software-defined data center (SDDC) vision. For an SDDC design and implementation, Unisys provides advisory services, along with application and infrastructure assessment, cloud/data center design and implementation and a robust hybrid IT management service. The DCTS helps clients transform their data centers from a cost center to an innovation center. Unisys provides custom SLAs for its services, which in turn provides the client with flexibility based on their requirement.
