

Manage and secure all devices

Centralize your endpoint management for a streamlined employee experience

Highlights

Manage your fleet of devices using a single, centralized platform.

Gain full visibility of all endpoints, whether traditional, mobile or virtual.

Streamline process improvements with advanced analytics and reporting capabilities.

Increase endpoint security through advanced threat protection, hard disk drive (HDD) encryption and AI.

Give your digital workforce consistent, fast, reliable, seamless access to corporate services and resources regardless of location.

Workforce productivity is closely tied to the devices employees use — and with the rise of hybrid work, those devices are growing in number, variety and complexity. Standard tools and processes must efficiently deliver a positive, secure experience across devices and apps.

Companies are under enormous pressure from two opposing forces. On the one hand, employees need access to corporate resources and applications anytime, anywhere on any device. On the other hand, enterprise devices must be secured against cyberattacks. How can you balance the two?

Resolve these dual pressures with Modern Device Management solutions from Unisys. Efficiently provision, track, image, secure, deploy and manage all devices and applications with a single unified endpoint management (UEM) solution.

With your fleet of devices fully protected, your employees can do their jobs in ways that fit their role requirements and work patterns. Deliver an employee experience that is seamless and consistent across all devices and locations, increasing satisfaction and boosting workforce productivity.

Device management made easy

Modern Device Management bridges the gap between legacy and modern platforms, giving you complete control over your entire fleet while minimizing management time. You gain:

- **A centralized solution:** Manage all your devices and applications — from onboarding to retirement, on-premises or in the cloud — from one UEM solution. Customized dashboards, control mechanisms, policies and protocols enable you to provision, update, migrate, block and monitor all devices.
- **Full visibility:** Gain complete visibility of all devices through a single pane of glass. Dashboards provide advanced analytics and reporting capabilities, letting you monitor device usage and detect patterns, recurring issues and requests.
- **Advanced threat protection:** Increase data security with the deployment, management and monitoring of antivirus agents and HDD encryption across endpoints. AI uses application-based behavioral analysis and crowdsourced data to identify threats in your endpoint environment, allowing for real-time remediation.
- **Reduced cost:** Reduce operational expenses, freeing up your top talent to focus on strategic projects.

Simplify device migration with Exodus

Migrating from one UEM platform to another can be complicated. Devices must be unenrolled from the legacy system before being reenrolled, leaving them vulnerable to data breaches and device loss. IT teams must recreate groups and policies on the new UEM solution post-move.

Unisys Exodus helps you seamlessly migrate devices with the following features:

- **Admin console:** Track users and device migration status, thanks to Exodus' real-time migration tracking via API integrations. Whether you are migrating 100, 1,000 or 10,000 devices, Exodus scales to your organization's needs.

- **Cloud-based infrastructure:** Exodus offers a flexible and scalable experience without requiring integration or deployment of additional equipment. Launch your migration efforts in waves, and your end users can complete their device migrations at their convenience.
- **UEM platform and OS support:** Whether you're switching on-premises or SaaS UEM tenants, Exodus can help you migrate Android, iOS and macOS devices. It also supports both iOS Automated Device Enrollment (ADE) and Android Enterprise.
- **Exodus companion app:** This end-user agent application walks users through the migration process in minutes compared to the hours often required by manual migration. The companion app checks the user's battery life, ensures Wi-Fi connectivity and sends status updates until the process is complete. Most importantly, the application tracks devices through the entire process, preventing devices from going missing when unenrolled.
