

Use case

Device Lifecycle Management

Securing device lifecycle management with visibility, control and compliance

Can you pinpoint where every device is, who's using it and whether it's secure? Asset visibility creates opportunities for stronger operational control and enhanced compliance across organizations of all sizes. Explore how forward-thinking global enterprises are transforming device lifecycle management with Unisys Device Lifecycle Management (DLM). DLM includes comprehensive security controls, real-time visibility and automated compliance frameworks. With Unisys Device Lifecycle Management, you gain agility and assurance. It protects your workforce and data globally. With Unisys, enterprises gain a scalable subscription model that empowers agility and enables global visibility.

Scenario

Organization size and scope:
Global enterprises with complex IT infrastructures and distributed asset management needs.

Objective:
Secure the entire device lifecycle while improving compliance, provisioning speed and geographic governance.

Device strategies require security-first thinking: end-to-end chain of custody, geolocation and geofencing controls, forecasting aligned with user needs and persona-driven provisioning. Without these controls, organizations risk lost devices, audit penalties and costly data breaches. IT teams manage constant demands: onboarding new hires, updating persona profiles, forecasting inventory and securely managing endpoints to maintain compliance.

How Unisys delivers value

Unisys helps you become proactive, enabling secure, efficient lifecycle oversight globally. The Device Lifecycle Management offers a security-first framework for global device lifecycle management that combines visibility, automation and control to reduce risk and improve IT agility.

- **Clarified ownership and roles:** Track each device across its entire journey—from order to factory, through warehouses and logistics, all the way to users at home or in the office and back again—with clearly defined ownership at every step to keep momentum and accountability high.
- **Standardized audits and governance:** Conduct monthly audits with defined action plans to create consistent oversight under strengthened governance frameworks that drive accountability.
- **Unified platform intelligence:** Integrate device data across logistics, service management, user provisioning and security platforms to create a single source of lifecycle truth and maintain configuration management database (CMDB) accuracy.
- **Dynamic persona provisioning:** Automate device setup and support compliance while using real telemetry to optimize your device catalog.
- **Geolocation and geofencing:** Ensure device usage remains within authorized locations; get instant alerts for policy violations.
- **Forecasting and demand insights:** Predict device needs based on attrition, onboarding trends and regional usage patterns, reducing overstock and emergency procurement.
- **Senior leadership support:** Highlight metrics and audit insights that show business impact, helping executives drive refresh and procurement strategies, streamline device management and reinforce compliance across departments.

ROI potential

Device Lifecycle Management helps you strengthen your security posture and operational efficiency, delivering measurable business impact across the device lifecycle in multiple areas:

- Reduced device loss and data exposure while enhancing reclamation through real-time chain-of-custody transparency
- Faster provisioning aligned to dynamic, curated user roles, minimizing downtime and easing IT workload
- Cost savings through intelligent refresh planning and improved forecasting to reduce stockpiling or urgent orders
- Compliance assurance through geofencing and audit-ready device insights
- Improved lifecycle ROI through automated return and redeployment processes, location-based optimization and right-sized devices based on data
- Stronger governance model aligned to enterprise security and regional regulatory requirements
